

DAY 03

Tools That Remember.

Build once. Use every day.

KASICODE

by Prestige Platform

Goal: Build an app that saves and recalls data

App: Customer & Stock Tracker

3 Hours · Day 3 of 5

WhatsApp export built in from the start

kasicode.app

Day 3. Halfway there. Let's add memory.

✓ Day 1: Your first app · Day 2: A tool your customer uses · Day 3: An app that runs your business daily.

0:00 – 0:30

What Memory Means

The difference between a demo and a daily business tool

← WE ARE HERE

0:30 – 1:45

Build It

Customer & Stock Tracker — saves automatically, works offline

1:45 – 2:15

Add AI Intelligence

Ask the AI questions about your own data

2:15 – 2:45

WhatsApp Export

One tap to send a summary to yourself or your team

2:45 – 3:00

What's Next

Day 4 preview + tonight's challenge

A demo disappears. A daily tool stays.

Everything we built on Days 1 and 2 resets when you close the tab.

Today we fix that — permanently.

WITHOUT MEMORY

- ✗ Data disappears on refresh
- ✗ No customer history
- ✗ No trend tracking
- ✗ Can't work offline
- ✗ Just a demo — not a tool

WITH MEMORY

- ✓ Saves every entry automatically
- ✓ Full customer history persists
- ✓ Track trends over time
- ✓ Works offline on any phone
- ✓ A real business tool you use daily

Your browser has a notebook.

We're going to write things in it.

localStorage — the technical name. The plain English name: a save file that lives on your device.

Lives on the device

Saved data stays in the browser on that phone or laptop. Works offline — no internet needed once the app is loaded.

Saves instantly

Every time a user adds something, it saves automatically. No 'Save' button needed. Nothing is lost on refresh.

Private and secure

Data is only accessible from that specific device and browser. Nobody else can see it — not even you as the builder.

Completely free

No database subscription. No server cost. No monthly bill. It's built into every browser on every device in the world.

localStorage or a database?

Here's how to decide.

USE localStorage WHEN...

- ✓ Only you use the app (personal tool)
- ✓ You use it on one phone or laptop
- ✓ You want it to work offline
- ✓ You're building in Day 3 of a cohort 😊
- ✓ The data doesn't need to be shared with staff
- ✓ You want zero running costs

USE A DATABASE WHEN...

- Multiple staff need to access the same data
- Customers fill in data on their own device
- You need data on multiple devices
- You want automatic cloud backup
- Your business grows and data volume is large
- Day 5 — we'll cover this when you're ready

Today's build:

Customer & Stock Tracker

Add customers and stock items. View your full list. Search instantly.

All data saves automatically and stays there when you come back tomorrow.

Auto-saves

no button needed

Works offline

no internet required

Instant search

find anyone in seconds

WhatsApp export

share summaries
instantly

Customer & Stock Tracker — features

Add entries quickly

One form, clear fields. Customer name, phone, what they bought, date. Or: product name, quantity, minimum level, cost price.

View and search your list

All entries in a scrollable list. Type any name to filter instantly. Find any customer or product in under 2 seconds.

Low stock alerts

When any product drops below your minimum level, it highlights in red at the top of the list with a 'Reorder' flag.

Edit and update

Tap any entry to update it. Change quantities, add notes, mark orders as complete. Your tracker stays accurate.

WhatsApp export

One tap generates a formatted summary — customer list or stock report — pre-filled as a WhatsApp message.

Offline first

Load the app once. After that, it works with zero internet. Your market, your shop, your site — everywhere.

Open KasiCode. Type your version.

Replace [brackets] with your actual business details. The more specific you are, the better the result.

YOUR PROMPT — customise the [brackets]

Build me a [customer tracker / stock tracker] app for my [type of business] business.

For customers, I want to record: name, phone number, what they bought, date, and any notes.

For stock, I want to record: product name, quantity in stock, minimum stock level, and cost price.

Show all entries in a searchable list. Highlight any stock below minimum level in red.

Save all data automatically so it's still there when I come back.

Add a "Share via WhatsApp" button that sends a formatted summary as a message.

Make it mobile-friendly and easy to use on a phone.

💡 Tip: Decide first — customer tracker OR stock tracker. Build one well today. Add the other tomorrow if you want.

75 minutes. Build your daily tool.

PHASE 1

0–20 min

Get the base working

- Type your customised prompt into KasiCode
- Run it — does the form appear?
- Add 3 real entries (real customers or real products)
- Refresh the page — are the entries still there?

PHASE 2

20–55 min

Customise your tracker

- Change fields to match your exact business
- Add your business name and colours
- Test the search — does it filter correctly?
- Check the low-stock alert if building a stock tracker

PHASE 3

55–75 min

Add intelligence + share

- Test the WhatsApp export button
- Check everything on your phone
- Add 10 real entries to feel like a real tool
- Share your app link in the WhatsApp group

Stuck? Use these prompts.

Copy and paste any of these into KasiCode when you need it.

Data not saving

"The entries I add disappear when I refresh. Fix this so all data saves automatically using localStorage and persists between sessions."

Search not working

"The search box doesn't filter the list when I type. Fix it so the list filters in real time as I type, searching all fields."

Add a notes field

"Add an optional 'Notes' field to each entry. Show a small note icon next to entries that have notes. Display the note when tapped."

Add entry count

"Show a summary at the top: total number of customers, and the date of the most recent entry."

Add a delete button

"Add a delete button to each entry in the list. Ask for confirmation before deleting. Make the button small and red."

Low stock alert

"Add a red warning banner at the top of the list showing all products where the current quantity is below the minimum level."

Better mobile layout

"The list entries are hard to read on my phone. Make each card bigger with more padding, larger text, and tappable buttons."

Export as WhatsApp message

"Add a 'Share via WhatsApp' button that sends a formatted summary: total entries, most recent 5 names, and today's date."

Your data is now smart.

Ask the AI questions about the information in your own tracker.

Use this prompt to connect AI to your tracker data:

```
"Add an AI assistant button to my tracker. When clicked, it reads all my saved data and lets me ask it questions in plain language – like 'which customers haven't ordered in 30 days?' or 'what is my lowest stock item?'. Show the AI's answer clearly below the button."
```

"Which customers haven't ordered in the last 30 days?"

"What products are below minimum stock and need reordering?"

"What is the total value of my current stock?"

"Who are my top 5 customers by number of orders?"

"How many new customers did I add this month?"

"Summarise my stock status in one paragraph for my supplier."

One tap. Your data goes where you need it.

In SA, sharing information happens on WhatsApp. Your tracker should work the same way.

Share with your team

Send the full customer list or stock report to a staff member, your partner, or a manager. One tap.

Reorder from your supplier

"Stock Report as of [date]: Product A: 2 units (reorder). Product B: 0 units (urgent)." Pre-filled and ready to send.

Daily business summary

Send yourself an end-of-day summary: new customers added, stock levels, anything flagged. Like a self-report.

Low stock alert to yourself

When stock drops critical, generate an urgent message to yourself instantly. Never run out of something important again.

"Add a 'Share via WhatsApp' button. It should send: business name, date, summary of entries, and any flagged items."

Adapt this tracker to your exact business.

The same prompt framework produces a completely different tool for every business type.

Hair Salon → Client Style Book

Fields: Name, hair type, last service, next appointment, stylist notes, colour formula used

⚠ Alert: Clients not visited in 60+ days

Builder / Trades → Materials Tracker

Fields: Material name, quantity on site, minimum needed, supplier, cost per unit, last ordered date

⚠ Alert: Below minimum — reorder now

Transport → Vehicle & Route Tracker

Fields: Driver name, vehicle, route, departure time, arrival time, fuel used, distance

⚠ Alert: Vehicles overdue for service

Caterer → Event Tracker

Fields: Client name, event date, number of guests, menu choice, deposit paid, balance owing

⚠ Alert: Events in the next 7 days

Tutor → Student Progress Tracker

Fields: Student name, grade, subject, sessions completed, homework completion rate, parent contact

⚠ Alert: Students below target progress

Retail → Supplier Contact Book

Fields: Supplier name, product category, contact number, last order date, usual lead time, payment terms

⚠ Alert: Suppliers not contacted in 30 days

Three days in. Look at the value stack.

DAY 1

Business Idea Validator

SWOT analysis tool

R2 000–5 000

market value

DAY 2

Customer Quote Generator

Professional quoting SaaS

R400–800/mo

market value

DAY 3

Customer & Stock Tracker

CRM / inventory system

R300–600/mo

market value

Three days. R7 000–15 000+ in tools. Two days still to go.

R500–1 000 course fee

Demo Time.

Show your tracker. Use real data.

Show us real entries

Add 2 or 3 real customers or products live. We want to see the save happen.

Show us the search

Type a name — watch the list filter instantly. Impressive every time.

Tap the WhatsApp button

Show us the message that gets generated. Does it look useful?

Ask the AI one question

Use the AI assistant to query your own data. Show us the answer.

Three days in. You understand data now.

Memory makes the difference

localStorage turns a demo into a tool you use every single day. Nothing disappears.

When to use what

localStorage for personal, single-device tools. A database when multiple people need the same data.

A real daily tool

Your tracker has real entries. It works offline. It saves automatically. It's a business tool you can use tomorrow morning.

AI can read your data

You can now ask questions about your own business data in plain language. That's something most businesses can't do.

WhatsApp as output

Data doesn't live in the app — it travels via WhatsApp to wherever it's needed. SA-native by design.

The value is compounding

Three tools in three days. Each one is something people pay R300–800/month for. You built all three for free.

Use it for real tonight.

The biggest lesson of Day 3 comes from actually using your tool on a real business task.

YOUR TASK

Add 10 real entries to your tracker tonight — real customers, real products, or real jobs.

Use the app as if it's already part of your daily routine.

Tomorrow, bring one thing you noticed: something you wish it could do that it currently can't.

Bonus challenges:

Ask the AI 3 questions about your data

Real questions you'd actually want answered about your business.

Send the WhatsApp export to yourself

How does it look? Is the information useful? What would you change?

Think about your Day 5 build

From your 3 ideas on Day 1, which one is most useful to your business right now?

See you tomorrow.

Day 4 — Build Something Shareable

Tools that spread. Tools that earn. The day your vibe coding becomes a business.

AI Quiz Generator

Build a quiz on any topic, share the link, track scores. Staff training, customer education, lead generation.

Lead Capture + Paywall

Require a name and number before showing results. Then charge for access. Your first digital product.

The Monetisation Talk

How to turn any tool you build into something people pay for. Yoco integration, payment gates, and pricing.
